The present sequence is 1 of 25 arbitrary 5' oligodecamer primers, which were used along with 4 degenerate 3' oligo dT primers for the differential display of human chondrocyte mRNA by reverse transcription and PCR (DDRT-PCR). Sequence analysis revealed the sequences of 52 cDNA clones, which were then searched against PDNA databases for homology to known human genes. The cDNA mols. can be used for the prodn. of gene specific primers and probes to isolate genes induced by treating (septembran) condrocytes with interlevin-lbeta (IL-lbeta), and for the diagnosis of IL-lbeta related connective tissue diseases, in partic.
                                                                                                                                                                                                                                                                                                                                                                                                                               Differential display of mRNA, reverse transcription, DDRT-PCR, human, chondrovyte; gene specific; primer; probe, isolation, interleukin-lbeta, IL-lbeta, diagnosis; connective tissue disease; oseteoarthritis; rheumatoid arthritis; polymerase chain reaction; ss.
rejection is taking place. The human AIF-1 gene and product are therefor useful in the diagnostic of transplant rejection. The diagnostic methods used allow rejection (vascular inflammation) to be detected at an early stage and require only a small amount of biopsy material
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosis and treatment of II-1 mediated connective tissue diseases - using osteopontin, calnexin, TSG-6 gene prod., genes encoding them or antibodies to them.

Arbitrary RT-PCR primers (AAT75138-42) were used to amplify mRNA from cells exposed to hyperphysiological, normal or subphysiological levels of homocysteine. PCR products were separated on a sequencing gel and discrete fractions which were increased or decreased were identified. This method was used to identify mRNA and the corresponding cDNA which are increased in the cells of a patient having hyperhomocysteinaemia or a predisposition to homocysteine mediated atherosclerosis. These polymucleotides can be used for the diagnosis and treatment of atherosclerotic diseases and diseases of metabolism of sulphur containing amino acids (e.g. homocysteinaemia), which are associated with vascular damage and atherosclerotic disease, specifically unstable angina, acute myocardial infarction (heart attack), cerebrovascular accidents (stroke), hypertension, renal artery stenosis, acutic stenosis and deep vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

PCR primers AAV15590 and AAV15591 are used to amplify fragments of the C4.8 and C21.7 genes from a human papillomavirus (HPV) immortalised human forestin keratinocyte cell line HPK-1A. These genes are characteristic of late or early passage cells can be used in a method for assessing the potential for progression of cervical lesions. Antibodies generated against the encoded polypeptide are used for diagnosis of cervical cancer and to assess potential for lesion progression. Antibodies can also be used therapeutically by inhibiting the polypeptide. Antisense molecules based on the nuclectide sequence are used to inhibit expression of the protein. Detecting polypeptides, or related RNA, characteristic of late passage cells (which are potentially malignant) in cervical smears is a reliable way of assessing progression potential
                                                                                           Nucleic acid characteristic of late or early passage cells immortalised by papilloma virus - and related polypeptide(s) and antibodies, used for diagnosis and treatment of cervical cancer and assessing potential for progression of cervical lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast, Saccharcmyces cerevisiae; transcriptome; cell cycle; regulation; eukaryotic cell; antifungal; SAGE tag; gene expression; serial analysis of gene expression; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast transcriptome - useful for modulating eukaryotic cell, for screening antifungal agents, and for identifying genes in cell cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Yeast tag for additional NORF chromosome 4 tag position 1324367.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      primers AAV10683-V10688 are used to obtain novel human breast cancer genes by differential display. The identified genes or fragments of these genes by differential display. The identified genes or fragments of the intimately used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the screen properties of cancer cells. It can also be used to design or screen disgnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Breast cancer genes - used to develop products to design or screen diagnostic reagents or therapeutic compounds.

Teast transcriptome is encoded by a DNA molecule comprising a yeast gene involved in cell cycle progression selected from the group of nonannotated GRF (MORE) genes. SAGE (serial analysis gene expression) tags for highly expressed genes and NORF genes are given in AAV50051 to AAV50345. The present invention describes: (1) a method of using yeast genes to modulate the cell cycle which comprises administering to a cell or isolated DNA molecule comprising a yeast gene which is involved in cell cycle progression selected from differentially expressed genes (SAGE tags given in AAV50051 to AAV50345); (2) a method for screening candidate antiturgal drugs which comprises contacting a test substance with a yeast cell and monitoring expression of a yeast gene which is involved in cell cycle progression; (3) a method of identifying human genes which are circled cycle progression which comprises hybridizing a probe comprising at least 10 contiguous nucleotides of a yeast gene which is differentially expressed between at least 2 phases selected from the log the phase in the cell cycle, where the probe for ascertanning the phase in the cell cycle, where the probe comprises the last 1 contiguous nucleotides of a NORF gene (SAGE tags given in AAV50051 to AAV50345), or as an array of probes on a solid support
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

PCR primer AAX34944-45 were used to amplify DNA encoding a dehiscence zone protein designated ORS7(9). The ORS7(9) polymucleotides and polypeptides are useful for regulating pod dehiscence and plant abscission. Antisense ORS7(9) nucleic acid useful for preventing or

reducing dehiscence or abscission

Example 1; Page 10; 20pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A nucleic acid encoding a signal transduction protein involved in plant dehiscence, useful for producing shatter resistant male sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes nucleic acids comprising human, murine or rat cDNAs encoding DRM proteins (derived from the down-regulated in v-mos crat cDNAs encoding DRM proteins (derived from the down-regulated in v-mos cuseful for arresting call growth; The nucleic acids, and DRM proteins, are useful for arresting call growth; Inhibiting tumour cell growth; treating hyperproliferative cellular disorders, either in vivo or ex vivo and producing fusion proteins with enhanced green fluorescent protein (EGFP) of increased stability (useful in screening assays, protein- protein (EGFP) of increased stability (useful in screening assays, protein- protein contenting abnormally low levels of DRM, or the nucleic acids, may be used to identify subjects with an increased risk of developing a contenting primers to detect or quantify drm and to screen genomic and companies and primers to detect or quantify drm and to screen genomic and companies. Antibodies raised against DRM can be used getect/quantify DRM in immunoassays. Fusion proteins of DRM and GFP are consisted to the nucleus (in contrast cytoplasmic localisation of GFP itself) and so are more stable, e.g. on exposure to fixatives or chergents, and thus form more versatile reagents, e.g. they can be used in fluorescence-based assays that require cell fixation, or linked to proteins or antibodies for use in enzyme-linked immunosorbent assays. Stable EGFP can be attached to proteins during synthesis, allowing the content sequence represents a PCR primer for rat DRM
                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding DRM protein, for regulation of cell growth, particularly treating cancer and.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cancer associated gene; cancer specific gene; C1-9a11-2; CH8-2a13-1; CH13-2a12-1; CH14-2a16-1; cancer; gene duplication; RNA overabundance; breast cancer; lung cancer; glioblastoma; pancreatic cancer; colon cancer; prostate cancer; hepatoma; myeloma; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a primer used to amplify Rin2 cDNA sequences. Rin2 polypeptides downregulate functional responses elicited by Ras-dependent signalling pathways. Agents that increase Rin2 activity (particularly Rin2 itself, optionally expressed from a vector) are used to treat allergy (asthma, hayfever or atopic eczema); Ras-dependent cancers and (non-)neoplastic cellular proliferation; autoimmune diseases, racell-associated diseases and T cell dependent graft vs. host disease (typical examples being type I diabetes mellitus; multiple sclerosis, Crohn's disease, autoimmune hepatitis and psoriasis). Agents that inhibit kin3 activity are used to improve wound healing; anglogenesis and/or respithelialization (also to improve immune response to pathogens; in human immune deficiency virus, and some other, infections; immune suppression associated with cancer therapy, and nerve regeneration)

These cancer specific genes are designated C1-9a11-2. CH8 -2a13.1. CH13-2a12-1, and CH14-2a16-1. These genes show RNA overabundance in a mijority of cancer cell lines tested, as well as a gene duplication in many of the cancers. Probes and primers derived from the polymucleotide sequence may be used to measure or detect altered gene duplication or overabundance of RNA in cancerous cells. This allows the screening of cancer, especially breast cancer, by correlating gene duplication of RNA overexpression obtained in this method with an increased risk for cancer. The polymetide, and its antibodies, are used as reagents for detecting altered protein expression in cancerous cells. Both the cancer associated polypeptide and polymucleotide may be used to gene therapy to treat cancers such as lung cancer, fleplastoma, myeloma and pancreatic cancer, colon cancer, prostate cancer, hepatoma, myeloma and
                                                                                                                                                                                                                                                                                         AAZ99299-Z99304 represent probes used to isolate cancer associated gene
                                                                                                                                                                         New cancer associated polypeptides, genes encoding them and antibodies against them, useful for diagnosing breast cancer and screening for anticancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AA277573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding imminostimulatory cofactor proteins which are preferentially or proteins which are preferentially copared differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell of the ottorior city of extractors play an important role in the activation of the Oytoxic immune response, particularly against tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone to the tumour cells, immunostimulatory cofactors also being required for insufficient octivation of cytotoxic Immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic call uses:

CT They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of fiferentially expressed genes in APC; and as hybridistation probes amplification primers for the diagnosis and monitoring of diseases related to abnormal cappens belonging to the monocyte lineage. Cells containing these genes cells as belonging to the monocyte lineage. Cells containing these genes complexion of an APC; and as hybridistion probes and cells and containing the expressed genes complexion of an active containing the expressed genes of the monocyte lineage. Cells containing these genes containing the expression of them are used in gene therapy. Co-administration of tumour antigens and presented to abnormal engagemented of an appearance of the containing tractors engagemented of the monocyte lineage. The production of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sites,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich si secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BP; 2 A; 4 C; 3 G; 1 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                 ö
                                                                                               The patent discloses fifteen new salicylic acid (SA) inducible genes from Nicotiana tabacum, nine of which were subcloned and sequenced. Based on different kinetics of induction response, these genes were classified into four categories, class I, II, III and IV response genes. The SA-inducible genes are useful for making transgenic plants with enhanced pathogen resistance. The plants incorporating these genes show reduced pathogen resistance. The plants incorporating these genes show reduced primer API used in differential display PCR reactions along with downstream primers T12MG or T12MC to identify tobacco SA-inducible genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed between metastatic non-metastatic breast cancer cells, useful for diagnosis, prevention
                                      Novel salicylic acid inducible genes from tobacco plants, useful for making transgenic plants with enhanced pathogenic resistance.
                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, metastatic breast tumour tissue; breast cancer; tag, primer, non-metastatic breast tumour tissue, gene therapy; anticancer; antimetastatic; vaccine; diagnosis; ss.

tissue (i.e. are upregulated in metastatic breast tumour cells). AA283942 to AA286677 represent tags corresponding to distinct transcripts that are to preferentially transcribed in the primary or non-metastatic breast tumour citissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially compounds that modulate expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen specific immune effecter cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen specific immune effecter for immorbace.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  임
that are preferentially transcribed in the metastatic breast tumour cells. that are preferentially transcribed in the metastatic breast tumour cells. AA286971 represent tags corresponding to distinct transcripts that are to AA286677 represent tags corresponding to distinct transcripts that are corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These crashed in the primary or non-metastatic breast tumour cells, transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and cranscripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of ceg. therapeutic genes (also ribozymes or antisense sequences), particularly an antisen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antisense or as therapeutic calls that produce the polypeptides or as therapeutic calls. Host cells that produce the polypeptides or as therapeutic calls, e.g. cytotoxic T lymphocytes, and these used for adoptive immunor herapen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells. AAZ83942 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can modulate expression of the transcripts are potentially compunds that modulate expression of the transcripts are potentially constituted to the transcripts are potentially constituted to the transcripts are potentially of the transcripts are located of larged expression, in selected cell types, of the transcripts are also useful in contines Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The invention relates to a novel method for the detection of polymorphisms in a DNA sequence. Test DNA and a second DNA are amplified with at least one palt of primers, and the sequence differences between the amplicons are compared. The primers are based on oligonucleotide sequences that are over-represented in the genome of the relevant corganism, and which are biased to one strand. The method can be used to requences that are over-represented in the genome of the relevant compared with an existing database. Secotype or strain, in which case amplicons are analysed for products, common to all members of the specific for strain or serotype, and the results compared with an existing database. The method can also be used to identify an individual, by comparison of results for a test DNA with an existing database. When applied to differential display analysis, pattern differences in the amplicons are determined, particularly by a cyanisms by species, strain or serotype, and to identify genes based on differential display. The method con identify individuals, to classify or granisms by species, strain or serotype, and to identify genes based on differential display. The method can also be used for genomic mapping, detecting changes in expression patterns, genetic linkage studies, medical display. The method can also be used for genomic mapping, medical display, forensics, and agriculture. The method cuses over-represented sequences to prime amplification. These sequences are faitured to complete Escherichiae call genome. The primers are rationally designed compared to the lagging strand of the E. coli K-12 genome. The primers are rationally designed primers based on over represented octamer sequences biased to the lagging strand of the E. coli K-12 genome. These primers and leading strand or primers based on ver-represented octamer sequences biased to the lagging strand of the E. coli K-12 genome. The sequences biased to the lagging crand of the E. coli M-1414 were used in the examplification of liferentiate and fu
                                                                          Detecting DNA polymorphisms, useful e.g. for identifying organisms by species, strain or serotype, comprises amplification with primers based on over-represented oligonucleotide sequences.
                                                                                                                                                                                               Example; Page 28; 49pp; English.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161.

AH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                          The present invention describes isolated DNA (I) encoding an allograft inflammatory factor-1 (AIF-1). AIF-1 has immunosuppressive, and antinflammatory and antiarteriosclerotic activities. AIF-1 is an inhibitor of expression of allograft factor such as Gal/GalNAc macrophage lectin. AIF-1 is useful for diagnosing and treating allograft rejection and other conditions associated to vascular inflammation, especially atherosclerosis. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynuclectides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                  DNA encoding an allograft inflammatory factor-1, useful for diagnosing and treating allograft rejection and other conditions associated with vascular inflammation, especially atherosclerosis.

                                                                                                                                                                                                                                                                                                                                                The invention provides a novel in vitro method for the detection of microorganisms and viruses. The method comprises: (1) forming a microorganisms and viruses. The method comprises: (1) forming a predetermined polymerase chain reaction (PCR) mixture by combining a predetermined couprising 5'-TAGAAGC-3', known amounts of a first primer comprising 5'-TAGAAGT-3', and a second primer comprising 5'-AGAAGTTCCCAAAGTCCCAAAGT-3', and a second primer comprising 5'-AGAAGTTCCTAAC-3', and PCR reagents; (2) forming a PCR product by cycling the PCR mixture to amplify the nucleic acid sequence, if present, complicate and attain 0.25-10000mug nucleotide product/mul mixture; (3) adding a probe containing DNA comprising 5'-GTGTGCTACTAAGCCACC-3' to the PCR mixture or to the PCR product to cause the DNA to hybridize with the nucleic acid sequence, if present, and change the conformation of the probe, and (4) determining whether or not bacteria are present in the probe on a sample by detecting the conformational change indicating the presence of bacteria in the sample. The methods can be used for the detection of viruses and microorganisms, the conformational change indicating the presence of bacteria in the sample. The methods can be used for the detection of viruses and microorganisms, the dod and cosmetic industry and in clinical diagnostics. Using the method it is not necessary to remove non-hybridized probe from the system

```

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (scrial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having contacting a yeast cell comprising contacting a yeast cell with a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and class of drugs having a characteristic cell with a candidate drug and expression in a yeast cell comprising contacting a yeast cell with a candidate drug and conticuing expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used to identify candidate drugs which affect the cell cycle in methods may be used to identify candidate drugs which affect the cell cycle the cell cycle and for identification of antifungal drugs which affect the cell cycle the cell cycle and for identification of antifungal drugs which affect the cell cycle of antification of antifungal drugs. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 247; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannocated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression contacting human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contisting contacting human DNA with a probe which comprises at least 10 contisting contacting human paracteristic effect on gene expression in a class of drugs having a characteristic ceffect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and

monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The cycle and for identification of antifungat drugs which affect the cell cycle and for identification of antifungation of the present invention. analysis of Yeast gene coding sequences comprising NORF genes with serial gene expression (SAGE) tags, useful for studying, monitoring a affecting phases of the cell cycle.

Example, Page 156; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) gene comprising a SAGB (serial analygis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human penes which are probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contacting human DNA with a probe which comparises at least 10 contacting human DNA with a probe which comparises at least 10 contacting human DNA with a probe which comparises at least 10 contacting human DNA with a probe which comparises at least 10 contacting contacting human DNA with a probe which comparises at least 10 contacting contacting contacting contacting contacting human DNA with a probe which contacting comprising contacting human DNA with a probe which comprises at least 1 contiguous nucleotides of a NORF gene whose expression varies as in M1;

```
and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

The sequence represents the rat arbitrary PCR primer AP-1, used in the invention to amplify cDNA from rat ovary tissue. The invention relates to a novel isolated UO-44 nucleic acid molecule comprising a sequence of

Example 2; Page 37; 82pp; English.

ö
nucleotides corresponding to a uterine oestrogen agonist-inducible genetic sequence in a mammal. The UO-44 sequences of the invention have vytostatic activity. The UO-44 polynucleotide is useful in the manufacture of a medicament for the treatment of a condition in a mammal, for treating, diagnoshing, detecting or monitoring uterine cancers and/or ovarian cancers, and for producing the polypeptide. The polynucleotide or polypeptide is useful for monitoring uterine and ovarian growth and development and the level of gestrogenic activity in tissue including cancer tissue. They are also useful for the generation of a range of therapeutic molecules capable of modulating oestrogen agonist-mediating cell growth and proliferation in the uterus including ovaries. The UO-44 polypeptide is useful to screen for naturally occurring antibodies to itself
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genotyping protease inhibitor 4 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphic site; screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to genotyping protease inhibitor (PI) 4 (kallistatin) gene of an individual, involves determining for the two copies of the Pid gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. PI4 gene is located chromosome 14g31-g32.1. Genotyping is useful for determining if an individual has a haplotype or haplotype pairs defined in the specification. Haplotype or haplotype pairs defined in the relability of several steps in the discovery and development of drugs for treating diseases associated with PI4 activity, e.g. acute pancreatitis, to validate PI4 as a candidate agent for treating a specific condition or disease predicted to be associated with PI4 activity, and in the design of clinical trials of candidate drugs for
                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                    .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A new microsatellite DNA derived from a Pyrus plant and discrimination of Pyrus plants by using it.
treating a specific condition or disease predicted to be associated with PI4 activity. The PI4 gene is useful in studying the expression and function of PI4, and in expressing PI4 protein for use in screening for candidate drugs to treat diseases related to PI4 activity. The present sequence is a primer to detect human PI4 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a novel microsatellite DNA sequence derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pyrus plants. The invention also comprises a method for discriminating Pyrus plants - utilising the novel Pyrus microsatellite DNA. The novel microsatellite DNA sequence can be used in discriminating Pyrus plants. The present DNA sequence represents a PCR primer specific for a novel Pyrus pyrifolia (sand pear) microsatellite DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a new polymucleotide with a sequence comprising an olfactory receptor, family 11, subfamily A, member 1 (CRILAI) isogene selected from 9 isogenes, with regions of a fully defined 8980 base pair sequence given in the specification. The polymorphisms controlled a locations are given in the specification. The invention is useful to haplotyping and genotyping the ORILAI gene in an individual. Other uses include predicting a haplotype pair for ORILAI gene of an individual, and for identifying an association between a trait and at controlled predicting the papers of ORILAI gene. The polymeptide is also useful in studying the expression and function of ORILAI, and in expressing ORILAI protein for use in screening for candidate drugs to creat diseases related to ORILAI activity of ORILAI as well as on the binding affinity of candidate drugs targeting ORILAI for the treatment of olfactory disorders. Without requiring any a prior knowledge of the binding affinity of candidate drugs targeting ORILAI for the treatment of the method of the invention provides the scientist with a tool to confeation of compounds that are more likely to show efficacy in clinical density lead compounds that are more likely to show efficacy in clinical confeation to detect polymorphisms in the human ORILAI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel genetic variants of Olfactory receptor, family 11, subfamily A, member 1 gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. olfactory disorders.
                                 Human; olfactory receptor, family 11, subfamily A, member 1; OR11A1; isogene; haplotyping; genotyping; olfactory disorder; SNP; primer; 88; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
Human OR11A1 gene polymorphism detection oligonucleotide primer #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

```
The present sequence relates to a new isolated nucleic acid molecule, which is expressed in endometrium and placenta and is upregulated in pregnant uterus and is highly expressed during placental development, encodes a protein having serine protease activity and has an insulin-like growth factor (IGF)-binding motif. The compound is considered gynecological, cytostatic and cardiant. The enzyme is specifically expressed in association with empty implantation and placentation in a pregnant uterus. The mucleic acid is useful for preparing a composition for treating PRSP-related condition e.g., infertility, endometriosis, cancer or a disease of the heart, testis or ovaries. Further, it is useful for detecting, diagnosing or monitoring a condition involving a change in PRSP expression. The sequence is present in the exemplification
            Endometrium, placenta, serine protease, gynecological; cytostatic, cardiant, PRSP, infertility, endometriosis, cancer, pregnancy, primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Colorectal cancer; colorectal adenoma; 88; human; renal dipeptidase; macrophage inhibitory cytokine; MIC; RDP; faeces; blood; kidney proximal tubule.

The invention relates to detecting CC (colorectal cancer e.g. colorectal adenoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC) cor renal dispetitaise (RDP) in faces or blood of a subject and comparing amount of MIC or RDP in taces or blood of a subject where and comparing amount of MIC or RDP detected to that in normal subjects, where of CC in elevated amount of MIC or RDP in the subject is an indicator of CC in RDP or RDP mRNA in the mRNA sample from facese of a subject, detecting MIC or RDP mRNA in the subject is an indicator of CC in subject; (c) isolating epithelial calls from blood of a subject, isolating an mRNA corrected to that in normal subjects, where an elevated amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample to amounts of MIC or RDP mRNA in normal subject, where an elevated amount of MIC or RDP mRNA in the mRNA sample is an indicative of CC in the subject; (d) contacting blood or facese of a subject, with a RDP substrate, detecting activity of RDP in the blood or faces by detection of increased reaction product or decreased RDP substrate, and comparing the amount of activity of RDP in the blood or faces of the subject is an indicator of CC in the subject; where an elevated amount of activity of RDP in the blood or faces of the subject is an indicator of CC in the subject in the moiety in the subject from outside of the subject and detecting the moiety in the subject from outside of the subject and care of localisation of the kidney identifies CC; or (f) administering to a subject from outside of the subject, and care of localisation of the kidney identifies of the subject or detecting in the subject is an indicator or RDP in the subject or detecting 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detecting in the faeces or blood RDP reaction product or RDP substrate with the detectable moiety, where increased product or decreased substrate in the faeces or blood indicates CC in the subject. The methods are useful for detecting colorectal cancer in a subject. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              is a DNA tag derived from a human transcript whose expression is
                                                                                                                                                                                                                                          Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood of the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                   The invention relates to a computer system for analysing nucleic acid sequences. The computer system is used to perform multiple methods for determining unknown bases by analysing the fluorescence intensities of hybridized nucleic acid probes. The results of individual experiments may be improved by processing nucleic acid sequences together. Comparative analysis of multiple experiments is also provided by displaying reference sequences in one area and sample sequences in another area on a display device. The computer system is also used to identify mutations in a sample nucleic acid. Sequences AAXOS784-787 repersent sequences with
                                                                                                                                                                                                   Identification of unknown base in nucleic acid sequence - using computer system to compare sequences by fluorescent intensities.
                                                                                                                                                                                                                                                                                                                                               mutant bases that were incorrectly called by the intensity ratio method

This invention describes a novel non-MRL healer mouse (M) having at least one quantitative trait locus selected from those given in the specification, exhibiting an enhanced healing response to a wound compared to mice (M) without the locus. The invention describes a novel method of identifying a gene involved in enhanced wound healing by identifying a gene involved in enhanced wound healing by described an enhanced wound healing by identifying microsatellite markers which segregate with enhanced wound healing at least one enhanced wound healing gene is chromosomal locus containing at least one enhanced wound healing gene identified. A method a treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and peripheral nerve wound. The methods of the invention are useful for restoring function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes methods for wound healing. Azisels-Zist represent murine SAGE tags from the method for which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          identification of mutation in nucleic acid sample using a computer aided

The invention provides a method of identifying mutations in sample nucleic acid, by analyzing fluorescent intensities of hybridized mucleic acid probes using a computer system. The method comprises: (a) inputting a first set of probe intensities; ach of the probe intensities is associated with a nucleic acid probe, indicating hybridization affinity between the associated mucleic acid probe intensities, each of the probe intensities is associated with a nucleic acid probe and indicating sequence; (b) inputting a second set of probe intensities is associated with a nucleic acid probe and indicating hybridization affinity between the associated nucleic acid probe and the probe intensities is associated nucleic acid probe and the cample sequences; (c) the computer system comparing probe intensities in the second set to select to select the probe intensities in the second set differ, with each region the probe intensities in the second set differ, with each regions to including multiple base positions; and (d) identifying mutations in the second conding to characteristics of the probes at specific conditing multiple base positions; and (d) identifying mutations in the second conditions, it becomes possible to extract information such as the monomer sequence of bNA, or RNA. Such systems can be used to form e.g. arrays of the probes in the selected regions. The probes is the PSI gene (relevant to certain cannows). HIV, and other conditions is and process the vast amounts of information now used and made available by pioneering technologies

Computer implementation for calling unknown bases in a sample nucleic acid sequence involves calling bases according to probe intensities, identifying mutant base call, and analyzing probe intensities near suspected mutation.

Disclosure; Col 49; 59pp; English

The specification describes a computer implemented method of calling unknown bases in a sample nucleic acid sequence. The method comprises calling bases of the sample nucleic acid sequence according to inputted probe intensities, identifying a mutant base call, analysing probe intensities of positions near the suspected mutation, and changing the mutant base call to nonmutant base call if probe intensities are inconsistent of a mutation. The method is used to study and detect mutations relevant to cystic fibrosis, the P53 gene (relevant to certain cancers), human immunodeficiency virus, and other genetic characteristics. The present sequence is used in the course of the invention X00000000000000X8

identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene screening fexpression.

Claim 8; Page 98; 325pp; German.

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin to identify that genes that show strong differential useful form. (A) comprises protein or mRNAMs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of shin ageing and/or stress; for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention

(A) comprises protein or mRNAMs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetric agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to identifying (MI) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful. for omprises protein or mRNAMs or their fragments. (MI) is useful for: identifying markers of skin ageing and/or stress; and identifying or determining the effects of sharmaceutical or cosmettic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying genes involved in skin stress and aging, useful e.g. in
screening for cosmetic or therapeutic agents, based on differential gene

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmacoutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.
                                                Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential expression.
                                                                                                                                                                                                                                                                                                                                                                       Sequence 11 BP; 1 A; 3 C; 5 G; 2 T; 0 U; 0 Other;

The present sequence is that of a human expressed sequence tag
(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or pronoctes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; roacea, melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (ESI) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST; expressed sequence tag; s6.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically schooled from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed and quantify their expression.

(M1) is useful for identifying genes and quantify their expression. determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriaals; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell cardinoma; and cardinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                       The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically seconded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sumburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (ESI) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                              The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriaas, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (BST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; soleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; cosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                        The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis; melanoma, basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to in vitro identification (M1) of genes expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin cincholates, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; scoacea, melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

Claim 24; Page 294; 1345pp; German.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically scored from skin, to serial analysis of gene expression (\$AGE) so as to identify skin-expressed genes and quantify their expression (\$AGE) (M1) is useful for identifying genes involved in skin homeostasis to determine skin homeostasis and to test agent (M) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis; atopot dermatitis, acne; sebornrea; lupus expressed since for the can be used for the can be used for the can be used for the can as all the described to the can be used for the can get the can be used for the can get the can be used for the can get the described to the can be used to the can be used to the can be used the can be used to the can be use the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis; scleroderma; inchthyosis; atopby dermatitis, acne, seborrhea; lupus expressed sich rosaces, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                   The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analytis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermaritis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (BST) of the invention
                                                                                                                                                                            In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention described a computer system for identifying an unknown base in a sample nucleic acid sequence. The method comprises analysing the fluorescence intensities of nucleic acid probes hybridised with at least one sample nucleic acid sequence. The computer system is useful for visualising, evaluating, and comparing biological sequences, for analysing fluorescent image files of a chip containing hybridised nucleic acid probes to call bases in a sample of nucleic acid sequence, and for identifying an unknown base in a sample nucleic acid sequence. This sequence represents an oligonucleotide used to demonstrate the nucleic Computer aided method of identifying unknown base in sample nucleic acid sequence, comprises analyzing the fluorescence intensities of nucleic acid probes hybridized with at least one sample nucleic acid sequence. New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.

Disclosure; Page 67; 120pp; English.

The specification describes antisense oligonucleotides (AAX52869-X55271)

codoning regions of RNAs corresponding to target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codoning regions of RNAs corresponding to target genes, gene initiation condant for juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5512-74. These multiple target oligonucleotides from sequences AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, caute asthma, allergies, asthma, impeded respiration, allergic rhinitis, coule asthma, allergies, asthma, impeded respiration, respiratory constructive pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary collisease (COPD), and cancers uch as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, paractic metastasses, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer. Producing specific polynucleotides using rolling templates.

Disclosure; Page 25; 109pp; English.

The invention relates to a method for producing polynucleotides having a defined sequence using rolling templates that successively add nucleotides (nts) to a longer primer and the method comprises: (i) incubating, under annealing conditions, a primer and a template that has a 5'-region not complementary to the primer, a 3'-region complementary to the primer, a 3'-region complementary to being shorter than the primer; (ii) reacting the primer with at least one nt in presence of a template-dependent polynucleotide polymerase to

```
extend it by at least one nt (complementary to the 5'-region of template) at its 3'-end; (iii) separating the template and the extended primer; and the valeating the cycle of (i)-(iii) as often as needed to synthesize the desired polynucleotide. The method is especially used to produce genes or their segments. The method provides fast, accurate, inexpensive synthesis of RNA or DNA and is more efficient than chemical coupling processes. It has higher specificity and eliminates the need for deprotection. The products can be cloned directly. The method avoids problems of waste disposal and includes an inherent editing effect (failure sequences will not be extended further in subsequent rounds) so that purification of the end product is facilitated. Synthesis may take optimized for a particular host can be prepared

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers.

Disclosure, Page 517; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation,

```
cffects afflict the lungs of a subject. They can be used for treating cf. schaemic conditions, pulmonary vasoconstriction, allergies, asthma, cimpeded respiration, respiratory distress syndrome, pain, cystic impeded respiration, respiratory distress syndrome, pain, cystic cfibrosis, pulmonary hypertension, emphysema, chronic obstructive conformary disease (CODD), and cancers such as leukamias, lymphomas, carcinomas, and cancers which may metastase to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the conscinctive and prostate cancer. The reduction of the adenosine content of the conscinctive and prostate cancer. The reduction of the adenosine content of the conscinctive and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present the invention, which correspond to SEQ ID NO:1 to 1815, and then the last 185 captences are also called SEQ ID NO:1 to 185, but the sequences differ cfrom the previously named sequences. SEQ ID NO:11 to 1680 (AAA3333 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention on the match intention of the intention of the present invention.

```
The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C) immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cattoring peptide factors and maignancies, such as stimulating and cattoring peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokine, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, confiding proteins, adhesion molecules and their receptors, cytokines and chemokine receptors, adenosine receptors, bradykinin receptors, cronsmitters, defensins, growth factors, vasoactive peptides and creaptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergic fining and/or antisense (CPD), allergic rhinitis (AR), pulmonary conditions, emphysema, chronic obstructive pulmonary disease (CPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAFIB434 to AAFIB434 represent human polynucleotide in the exemplification of the process.

Claim 1; SEQ ID NO 286531; 29pp + Sequence Listing; German

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE99989, ABF00010-ABE99989, ABH00010-ABH99989 and ABI00010-ABI32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic discorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABC00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic formmat from WIPO at this patchiod, but we obtained in electronic format from WIPO at
                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide primer SEQ ID NO 323899 for detecting SNP TSC0031670.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                     Oligonucleotide primer SEQ ID NO 310576 for detecting SNP TSC0024024.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at this point/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 8s; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide primer SEQ ID NO 323902 for detecting SNP TSC0031670.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of cligonuclectides, useful for diagnosis and cell typing, idesigned to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, : designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 323902; 29pp + Sequence Listing; German
                                                                                                                                                                                                                                                                                         claim 1; SEQ ID NO 286544; 29pp + Sequence Listing; German
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   40.0%; Score 8; DB 1; Length 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC09989, ABF00010-ABF9989, ABH00010-ABH99899 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP: single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim i, SEQ ID NO 310552; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 targesem the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Seguence 12 BP; 0 A; 2 C; 6 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99889 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic formmat from WIPO at the printed specification, but the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide primer SEQ ID NO 286534 for detecting SNP TSC0012735.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disconders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABC00010-ABC09989, ABC00010-ABC09989 ABC00010-ABC0010 ABC0010-ABC0010 ABC0010-ABC0010 ABC0010 ABC0010
                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABT00010-ABIS2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, azdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 8s; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prereated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic diseorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99899, ABH00010-ABH99899 and ABI00010-ABI82073 tapesent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at this pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonucleotide primer SEQ ID NO 286479 for detecting SNP TSC0012735.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at first patent did not man will be a printed specification, but fip.wipo.int/pub/published_pct_sequences
acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomeclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

ö This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 8s; central nervous system; gastrointestinal; respiratory; immune; metabolic. Gaps Oligonucleotide primer SEQ ID NO 310603 for detecting SNP TSC0024025. Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine ô Claim 1; SEQ ID NO 310603; 29pp + Sequence Listing; German. 0; Indels DB 1; Length 12; 5. 1.3e+02; Sequence 12 BP; 4 A; 5 C; 2 G; 1 T; 0 U; 0 Other; 40.0%; Score 8; DB 1 100.0%; Pred. The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an Oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a Polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlenamatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypoteasive, cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in a prophylactic or therapeutic respiratory effect of an entitinflammatory stepricial or therapeutic respiratory of alteriors or ceceptor, producing bronchodilation, increasing levels of adenosine or condition. The sequence data for this patent is not represented in the printed or the printed

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The present invention describes a vector for increasing the copy number of plasmids, comprising a transposable element containing a high copy number origin of replication capable of transposition into a target plasmid. The vector may be prEANS-SacB, pTRANS or pBacTA, PUC2. The vector an be used to facilitate the cloning of large inserts into BAC plasmids, including full-length genes, the isolation of large amounts of BAC plasmids, and the increased expression of BAC genes. They can also be used to generate shuttle vectors without cloning
portion of T. reesei HAC1 protein (see AAB82975) fused to the Escherichia coli maltose-binding protein malE. The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1. PrC2 or IRE1 in the cell. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein of interest can be any secreted on l1-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel vector for increasing copy number and gene expression in plasmids, comprises transposable element containing high copy number origin of replication capable of in vitro transposition into target plasmid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               number; cloning; gene expression; pTRANS; pTRANS-SacB;

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from expression. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining the effects of pharmaceutical or cosmetic agents for control of skin ageing the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ85246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

identification of skin-expressed genes, useful for determining is and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

Disclosure; Page 154; 1345pp; German

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to sarial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin clostofically neurodermatitis; sunburn; psoriaeis, specifically neurodermatitis; sunburn; psoriaeis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from Skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sumburn; psoriatis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

```
The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression (SAGE) (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin ichthyosis; stopic dermatitis; acnes; sebornhea; lupus expthematosus; inchivosis; atopic dermatitis; acnes; sebornhea; lupus expthematosus; rosacea; melanoma; basal call carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                               In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically scooled factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to teet agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermaitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; subburn; psoriasis; scleroderma; inchthyosis atopic dermatitis; acnown, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhasic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.

                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; cosecea, melanomi, basal cell carcinoma; and carcinoma or sarcone of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

```
The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis of that can be used for treating skin disorders, specifically neurodermatitis, sunburn; psoriasis; scleroderma; inchthyosis; atopic dermatitis, acne, seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In vitro identification of skin-expressed genes, useful for determining homeostagis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                      Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriaals; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                           In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.

                                                                                                                                                                The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE)

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins selful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present DNA sequence is Trichoderma reessi bipl promoter UPR element, bipUPREI which bind HACI-malE protein. (Updated on 29-AUG-2003 to standardise OS field)
so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to that can be used for trating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Heterologous protein secretion; unfolded protein response; UPR; lipase; cellulase; carbohydrase; industry; purification; HAC1-malE protein; bipl promoter; bipUPRE1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Saloheimo MLA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of an antisense oligonucleotide which can be used for inhibiting growth or replication of herpesviruses. It corresponds to an antisense sequence of a herpesvirus site, pref. in a gene that is essential for synthesising nucleic acids e.g. the immediate early genes or Wmw65. It can be prepd by solid phase triester or phosphor amidite chemistry or by recombinant DNA techniques. It can be used for treating infection by herpesviruses, e.g. herpes simplex type I (HSV-1) and type (HSV-2), varicella zoster (VSV), Epstein-Barr (EBV), cycomegalovirus (CWV), human herpesvirus growth or replication may indirectly forestall the progression of events from HIV exposure to the clinical manifestation of AIDS. It may also be useful in the detection, diagnosis and manipulation of herpes virus. See also AAQ23764-Q23788 and AAQ24014-Q24044. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New anti:sense oligo:nucleotide(s) for inhibiting HSV - also used for diagnosis and for inhibiting HIV activation by herpes virus.

coligonucleotides of series 1,AAT63014-21, have specific anti-mRNA sequences to the 5' untranslated cap region of tumour necrosis factor (TNF) -alpha mRNA. These oligonucleotides are an example of a new chimeric oligonucleotide library, used to identify an antisense binding site in a target mRNA (in this case TNF-alpha). The library comprises a set of distinct chimeric oligonucleotides capable of hybridising to mRNA to form a duplex, the nucleotides sequences of which each have a common length of 7-20 bases. All of the nucleotides of the common length which are present as subsequences in the target mRNA are present in the library. Bach as subsequences in the target mRNA are present in the library. Bach as uncleotides sequence comprises a recognition region recognisable by a duplex-cutting RNAse, and a flanking region of chemically modified nucleotides which binds to the mRNA sufficiently tightly to stabilise the duplex for the RNAse. Each oligonucleotide is protected against chimal effective antisense compounds against specific mRNA targets. The antisense compounds against specific mRNA targets. The antisense compounds against specific mRNA targets. The consideration of the repentic agents, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RT-PCR; primer; amplification; reverse transcription; RNA fingerprinting;

The invention provides a method for the differential screening of gene expression by random primed reverse transcription PCR (RT-PCR). The primer sequences are generated by stimulating PCR reactions on nonrequired mammalian nuclectide sequence databank entries containing at least 1,000 bp of coding region. The primers selected, such as the present one, had to meet various criterial such as having an efficiency index between 2-10, having a selectivity index higher than 1, being 12 bp in at least 5 of the 8 bases at the 3'-end. The invention claims the selected primers make it possible to use internally primed, PCR-based RNA fingerprinting for simple, exhaustive and systematic analysis of differential gene expression as an advantageous alternative to differential display. The method can also be useful for isolating new coding sequences and to compare known and new genes
                                                                                                                                                                                                                                                                                          Differential screening of gene expression by reverse transcription polymerase chain reaction – uses random priming with primers selected for high efficiency and selectivity by computer screening of database(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amplification, polymerase chain reaction, PCR; microorganism, compost, detection, pollutant, soil, food, agricultural chemical, polymer,

The present invention describes a method for detecting (D) at least 1 protein-protein interaction (PPI) by recombinantly expressing within a population of fast calls, populations of first and second fusion proteins comprising DNA binding domain (DBD) and transcriptional regulatory domain (TRD) respectively and detecting the regulation of transcription of the nucleotide sequence of host cells operably linked to a promoter driven DBD. The detection method (D) is useful for identifying inhibitors of PDI for therapeutic use, and for detecting specific cell types, tissue types, argae of development and disease states. From the population of the proteins characteristic of the particular tissue or a cell-type, all possible detectable PDI that occur can be identified and genes encoding these proteins can be isolated. Thus, parallel analysis of two cell types enumerates PDI that are common to both and those that are specific to both. This analysis has significant value since PPI specific to a disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
